

# *political economy* Studies in the Surplus Approach

volume 6, numbers 1-2, 1990

3 **Announcement: suspension of publication**

*special issue*

**Convergence to Long-Period Positions**

Proceedings of the Workshop held at Certosa di Pontignano, Siena, April 5-7 1990

5 **Mauro Caminati and Fabio Petri**, Preface

11 **Mauro Caminati**, Gravitation: An Introduction

Part I

45 **Richard Goodwin**, Inaugural Speech

47 **Luciano Boggio**, The Dynamic Stability of Production Prices: A Synthetic Discussion of Models and Results

59 **Marco Lippi**, Production Prices and Dynamic Stability: Comment on Boggio

69 **Ian Steedman**, Questions and Suggestions re Gravitation

73 **Peter Flaschel**, Cross-Dual Dynamics, Derivative Control and Global Stability: A Neoclassical Presentation of a Classical Theme

93 **Michio Morishima**, Comment on Flaschel

Part II

95 **Andrea Salanti**, The Notion of Long-Period Positions: A Useful Abstraction or a "Platonic Idea"?

103 **Alessandro Roncaglia**, Is the Notion of Long-Period Positions Compatible with Classical Political Economy?

113 **Sergio Parrinello**, Some Reflexions on Classical Equilibrium, Expectations and Random Disturbances

125 **Cristian Bidard**, From Arrow-Debreu to Sraffa

139 **Bertram Schefold**, Joint Production, Intertemporal Preferences and Long-Period Equilibrium. A Comment on Bidard

Part III

- 165 **Richard Goodwin**, Convergence to Strange Long-Period Positions
- 175 **Ingrid Kubin**, Market Prices and Natural Prices: A Model with a Value Effectual Demand
- 193 **Willi Semmler**, On Composite Market Dynamics: Simultaneous Microeconomic Price and Quantity Adjustments
- 221 **Dominique Torre**, On Composite Classical and Keynesian Microdynamic Adjustment Processes: A Comment
- 229 **G rard Dum nil** and **Dominique L vy**, Stability in Capitalism: Are Long-Term Positions the Problem? With an Addendum
- 279 **Jean Cartelier**, The Stability Problem in Capitalism: Are Long-Term Positions the Problem? A Comment on Dum nil and L vy
- 287 **Richard Arena**, **Claud Froeschle** and **Dominique Torre**, Gravitation Theory: Two Illustrative Models
- 309 **Giancarlo Gozzi**, On Gravitation from the Classical Viewpoint: A Comment on Arena, Froeschle and Torre
- 317 **Ulrich Krause**, Gravitation Processes and Technical Change: Convergence to Fractal Patterns and Path Stability
- 329 **Pierangelo Garegnani**, On Some Supposed Obstacles to the Tendency of Market Prices towards Natural Prices

# Inaugural Speech

Richard Goodwin

It gives me great pleasure to open this conference and welcome you all to the delightful surroundings of the Certosa di Pontignano. I have always found it a most attractive place for working, for making contacts with others, for relaxation. Before joining the Faculty of Siena, I had often stayed here briefly for giving lectures or a seminar. I had found it such an attractive place to be that I looked forward to living in the Certosa, but that, alas, could not be.

We are here to discuss a traditional conception which remains important, and with remaining unsolved issues. I feel happy to say a few words of introduction, since it gives me a chance to have my say first! The timing of the conference could not have been better chosen, since it assumes a peculiar relevance and significance at a time when there has been a final and dramatic rejection of central, bureaucratic planning of the economy in favour of competitive, price-market control.

From Adam Smith through the Classical economists to Walras, the theory and analysis of auto-control by market adjustment mechanisms has occupied a central place in our discipline. Walras really stated the problem in all its complexity and, in a sense, has dominated analysis ever since. As far as I understand it, he wanted to prove the existence and uniqueness of general equilibrium: he did this by a constructive proof, which was judged good, but not good enough. Since he used a sequential or iterative procedure he sometimes seems to imply dynamical analysis. Schumpeter as a young man in pursuit of better dynamic processes, visited him in search of fruitful ideas, but reported that he found no serious interest in dynamics, a view with which I agree, but I believe Professor Morishima disagrees.

Both he and I have independently found the Walrasian approach suggestive and useful in gaining insight into convergence to equilibrium positions. We have tried to consider the difference between demand and output as leading to an equilibrium fixed point: likewise the difference between price and cost as bringing them into equality. And, of course, in

the long shadow of Keynes, one has to consider the impact of output on both demand and price as well as the effects of cost and price on output.

The analysis of these dynamical trajectories in the context of the vast number of markets and agents and agents presents awesome difficulties. To keep matters as simple as possible, it is helpful to use the linear assumption that reactions to differences between supply and demand or price and cost, are proportional to the size of the differences, (This was, I believe, the aim of Walras). To reduce the complexity of the analysis, I tried using potential theory as determinant of the vector fields of trajectories. I found it helpful to determine the eigenvalues of the system and the eigenvectors of output and of price. Proceeding in this way, I found that for an economy with a net product, the real parts of all eigenvalues would be negative, and hence a given system would be unambiguously stable asymptotically to its fixed points. For a more complicated system, however, Professors Flaschel and Semmler have produced more than one unstable counterexample. Professor Boggio has also found a solution not in agreement with mine and therefore finds my method lacking in mathematical rigour (to which I readily confess), and potentially misleading (which I plainly did not intend). So now that I have had the pleasure of the first word, I leave to them, if they choose, the pleasures of the last word!

It is worth noting that systems theory provides at least two other elementary types of control — derivative and integral. Thus not only the level of price, but also its rate and direction of change, may matter; and perhaps even more so for demand and output. Thus, given the stochastic nature of economic variables, producers may relate output more to the level of stocks than of demand. Or central banks presumably pay more attention to their stock of foreign exchange than to the day to day gyrations of the market.

I found it interesting to arrive at a stable dynamic conclusion, since it means the desires of all economists are satisfied: no matter how often disturbed, the economy was always at or near equilibrium and always approaching it. This gave the happy reassurance that one could give full scope to the analysis of productive structure and equilibrium values and outputs, to the exclusion of endogenous turbulence. For myself I think the economy tends to be unstable locally around equilibrium and only stable globally.

With that reassuring reflection, I declare the Conference open.
